**GIC**  
Geoinformatics Center

# Partnership for the Development of RiskChanges

The Asian Institute of Technology (AIT) is an international postgraduate institution, focusing on engineering, environment, and management studies.

- AIT ranks 19<sup>th</sup> in World in SDG-1 (No Poverty)
- 30 academic programs
- 22,789 alumni from 101 countries

To develop capacity, particularly in less developed countries, and to utilize geospatial solutions to deal with national and global problems.

- Large alumni network
- M.Sc., Ph.D., online
- Development related

## Common aspects:

- Large alumni network
- Alumni in leading positions
- Capacity development
- Joint projects

[www.charim.net](http://www.charim.net)

# Collaborative Projects AIT & ITC on Risk Assessment

- (1) Caribbean Handbook on Risk Info. Management – **Regional** (WB)
- (2) Multi-hazard Risk Assessment in Tajikistan – **National** (UNDP)
- (3) Developing Risk Sensitive Land Use Plan (RSLUP) – **Local** (USAID)

# Caribbean Handbook on Risk Info. Management (Regional-level)

## Caribbean Handbook on Risk Management

The aim of this on-line handbook is to support the generation and application of landslide and flood hazard and risk information to inform projects and program of planning and infrastructure sectors, specifically targeted to small countries in the Caribbean region. The methodology centers around a series of use cases, which are practical examples.

**Caribbean Handbook on Risk Information Management**

 An initiative of the African, Caribbean and Pacific Group, funded by the European Union and managed by GFDRR

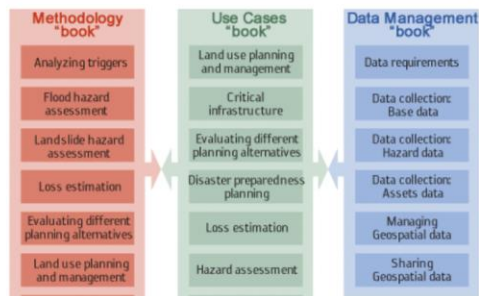

opportunities for all | Log in

### The handbook is made of 3 interlinked components:

**Use case book**, which illustrates the steps required to use the hazard and risk information in so-called use cases (example) for planning of infrastructure, planning of risk reduction measures, emergency preparedness and emergency response. A number of these examples consist of actual step-by-step exercises which also contain data, and which use an Open source GIS software.

**Methodology book**, which focuses on the methods for generating landslide and flood hazard and risk information for different scales (nationwide, and for detailed areas) and taking into account different situations of data availability.

**Data management book**, which indicates the aspects related to use collection, management and sharing of spatial data related to

**BZE:**  
 Area 22,966 km<sup>2</sup>  
 Pop. 232,111  
 Pop. Dens. 12 pers/km<sup>2</sup>

**DOM:**  
 Area 751 km<sup>2</sup>  
 Pop. 69,625  
 Pop. Dens. 93 pers/km<sup>2</sup>

**SLU:**  
 Area 616 km<sup>2</sup>  
 Pop. 157,490  
 Pop. Dens. 258 pers/km<sup>2</sup>

**SVG: (Archipelago)**  
 Area 386 km<sup>2</sup>  
 Pop. 106,253  
 Pop. Dens. 277 pers/km<sup>2</sup>

**GRE: (3 islands)**  
 Area 344 km<sup>2</sup>  
 Pop. 102,598  
 Pop. Dens. 300 pers/km<sup>2</sup>

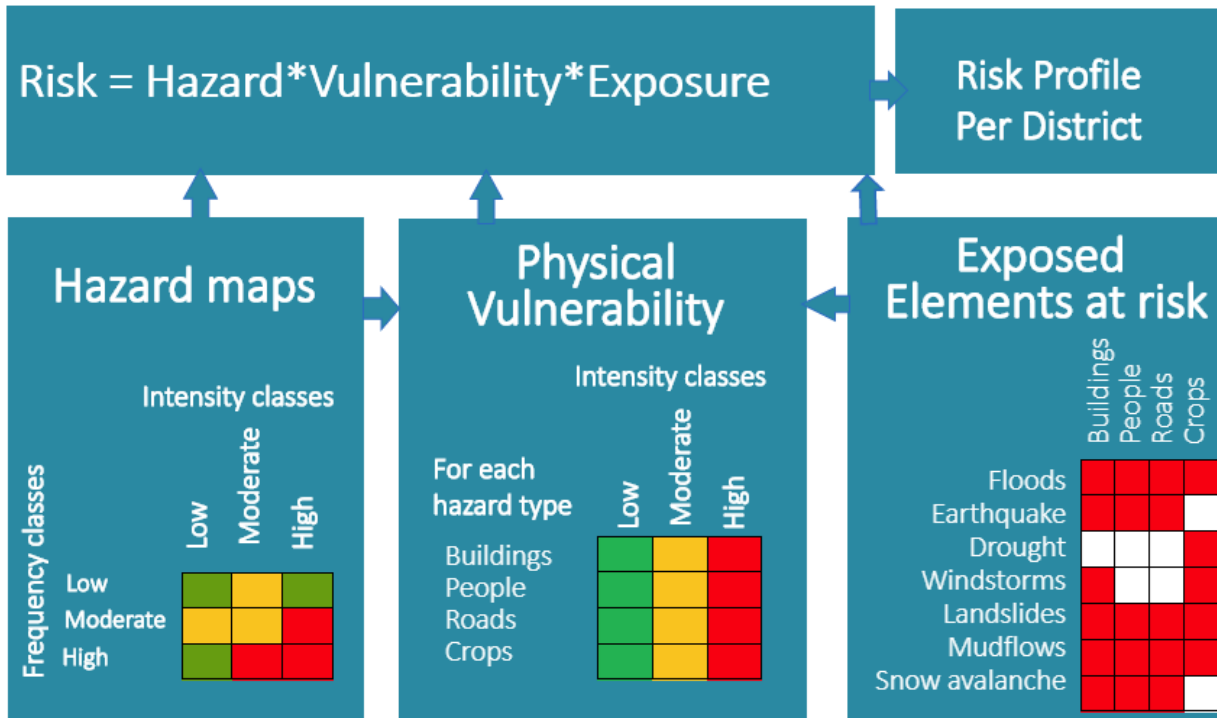

# Multi-Hazard Risk in Tajikistan (National-level)

## Limitations

- Data poor region / lack of data sharing
- No intensity maps for all hazards
- Limited historical hazard data

## Accomplishments

- Established the GeoNode to input / output data
- Hazard susceptibility maps
- Density of phenomena per return period

# Motivation for Developing RiskChanges

- Non-availability of multi-hazard risk assessment tools at local level
- Often too complex
- Too data intensive
- Some are country or region specific
- Some of them require to link with external software and/or data
- No multi-hazard interactions and don't provide loss and risk information
- Do not include risk reduction alternatives
- Do not include future scenarios

## Examples:

# Motivation for Developing RiskChanges

- Open-source
- Web-based and data processing in cloud
- Generic (for hazards, Elements-at-risk, scale)
- Based on multi-hazard concept
- Loss estimation (physical & population)
- Risk assessment (by spatial/admin units)
- Analyze current and future risk
- Analyze risk reduction alternatives
- Designed for users with limited expertise in modeling
- Flexible in terms of data requirement
- Integrate expert opinion when data is not sufficient
- Perform cost-benefit analysis
- Availability of multi-criteria evaluation

## What is it about?

In order to understand more about the tool and the various components, the best is to follow the tutorial video below, which will explain the basics of the systems and the various components. Throughout the system there will be similar videos that explain how the individual components work.

[Watch video tutorial](#)

# RiskChanges

An open-source Spatial Decision Support tool for the analysis of Dynamic Multi-Hazard risk:  
Visualize and compare your results in different ways

## You need to log in

The tool allows you to do the risk calculation in the cloud, and you can store your own data (up to a maximum of 1 GB) for free. You can create a project and collaborate with other colleagues on the project. For this you need to have your own user account. You can be an administrator (create and your own projects) or normal user.

[Watch video tutorial](#)

### Data Management

Upload your own data hazard data, asset data and administrative units, using shapefiles or GeoTiffs. Or link to web-databases

### Vulnerability Curves

Upload or create your own curves, or use existing ones from a database for different hazard types

### Exposure Analysis

Calculate the hazard intensity for individual asset components. Can be used as basic risk maps if no other data is available

### Loss analysis

Calculate losses by integrating exposure and vulnerability for specific combinations of hazards and assets. For individual units, or aggregated in administrative units

### Risk Analysis

Calculate single or multi-hazard risk. Define hazard interactions. Using risk curves

### Visualization

Visualise single or multiple input maps, exposure and risk maps

## Many Tasks, One System

Major Features of the RiskChanges SDSS are:

### Multi-Hazard

Analyze the risk for multiple natural and man made hazards and their interactions

### Multiple Assets

Analyze the risk for multiple asset types with varying spatial characteristics

### Vulnerability Database

Access a database of physical vulnerability curves and share your own ones

### Multi User

Different users provide input data to the same project

### Compare Risk

Compare current risk with future scenarios and planning alternatives

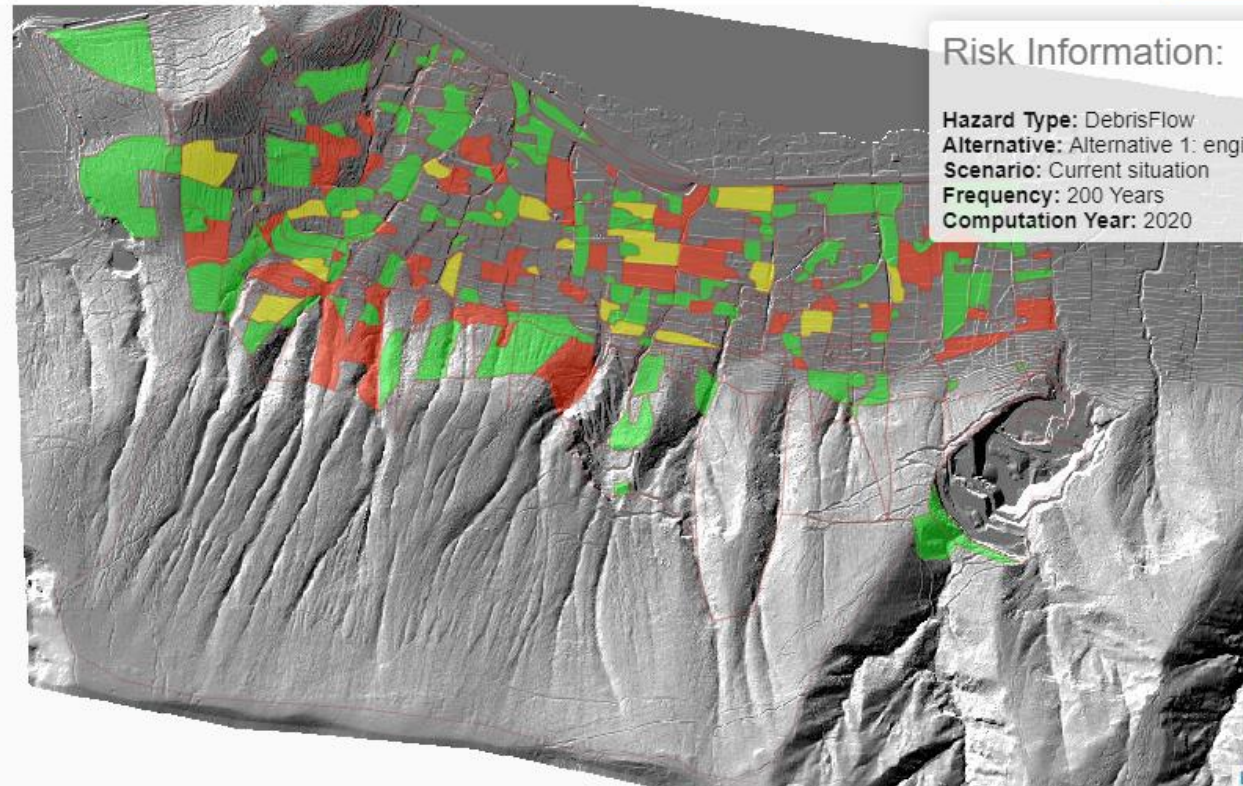

### Spatial Analysis

Spatially analyze risk using a web-based map interface

## Try RiskChanges

This small application, for a hypothetical study area, allows you to view the results of loss estimations for three types of hazards (floods, debris flows and landslides), four frequencies (20 to 200 years Return Period), and for different scenarios (related to climate change and land use change) and risk reduction alternatives. Make your own selection and see how the risk pattern changes.

DebrisFlow ▾ 200 Years ▾ Current situation ▾ Alternative 1: engineering solutions ▾ [Load Data](#)

# Which Elements-at-risk

- **Point data**
  - Specific objects (essential facilities, cultural heritage, high potential loss facilities)
- **Line data**
  - Transportation networks, electricity, communication, water, gas, oil
- **Building footprints**
  - Most standard approach
- **Land parcels**
  - Land cover, agriculture, forest, for future projections
- **Raster grids**
  - Population density over large areas.

# Vulnerability Curve Database

- Vulnerability types:
  - Physical
  - Population
- Use existing curves
- Upload new curves

**Element at Risk**

1 upload data      2 metadata      3 column connection      4 vulnerability connection

Flash flood | Height | Physical | Select vulnerability source | Select vulnerability valid req

**Note:** Please make sure to connect all the EAR class with vulnerability. Otherwise it will throw an error message in the loss calculation.
